

I would like to lend my support to the Emergency Vehicle Signaling System technology (EVSS) with you and the Federal Communications Commission. I have been in police work for thirty years and am now in the security field. This system is unique and something the Policing Industry needs, to save lives. In this day and age of cellular telephones, soundproof cars, and loud radios, police need to get the attention of the motoring public. It is a different world now. Police need to get to their destinations safely to save lives without the inattentive drivers that are now distracted by too many things around them. This is a wake up call for drivers to be alerted of oncoming emergency vehicles. Sirens have drowned out radio stations for years without protest, this is more like an internal siren, but is a warning to surrounding traffic to HELP SAVE LIVES. I believe this is a great product which needs immediate approval to help our police help others, safely. Many innovative ideas find bumps in the road, even though they are created with safety of others in mind. This is one of those products.

Sincerely, Joseph M. Getsinger
